

• A PROPOSED DIRECTION

Set the rules.
Hire Falcon.

A personal financial agent for people who want their idle money managed within clear limits.

- Start with investable USDC. Expand after proof.

CURRENT CODE · SOURCE CHECKED

Advisory + Devnet terminal

FIRST MVP · PROPOSED

One capped USDC lending position

View progress →

01

FIRST MVP

One strategy

One lending position. A fixed investment budget.

SOLANA · NATIVE USDC ↗

02

EXPANSION

Several venues

Compare lending positions and their shared risks.

ONE CHAIN · SEVERAL VENUES ↗

03

EXPANSION

Across chains

Track capital across accounts and transfer states.

SEPARATE CHAIN ACCOUNTS ↗

04

EXPANSION

Personal finance

Coordinate cash goals and eligible investment accounts.

MORE GOALS · DISTINCT ACCOUNTS ↗

THE CORE STAYS

Evidence → decision graph → policy checks → execution → observed result.
Each stage expands the mandate. The owner keeps control of its limits.

INFERRED · Every stage is a proposed architecture. No stage is labelled shipped.

[See current evidence and open decisions](#)

Put idle USDC to work.

The user sets the reserve and investment cap. Falcon manages one permitted lending position.

ARCHITECTURE NOTE

Decision graph

The graph is decision input. It links user needs, positions, liquidity, collateral dependencies, and observations to a proposed action.

USER OUTCOME

The user keeps a spending reserve and delegates only their investable USDC.

PROOF BEFORE EXPANSION

1. Confirm deposit and redemption with owner signatures.
2. Prove receipt ownership, amount limits, and allowed recipients.
3. Reject revoked authority, extra instructions, and stale inputs.
4. Then complete the loop with restricted automatic execution.

What this stage adds

Build the first complete path: approved budget, graph decision, checked transaction, and confirmed outcome.

What remains open

Exact Kamino reserve, Swig permission enforcement, and funded-user eligibility.

Allocate with context.

Add approved Solana lending venues. Move funds only when expected benefit justifies costs and fits the mandate.

ONE CHAIN · SEVERAL VENUES

— Asset movement Evidence ---- Authority — Action request

ILLUSTRATIVE SCENARIO · NO LIVE DATA

A new venue shares existing risk

See why another venue does not automatically create diversification.

What this stage adds

Add venue adapters and an allocation policy. Keep one owner, one USDC budget, and the same execution controls.

What remains open

Which additional venue creates enough benefit after costs and shared risks.

ARCHITECTURE NOTE

USDC issuer

Every USDC lending position keeps exposure to the same stablecoin issuer. Different venues do not remove this common risk.

USER OUTCOME

The user delegates allocation across approved venues within one total risk budget.

PROOF BEFORE EXPANSION

1. Measure net results against the chosen single-venue baseline.
2. Count shared issuer, collateral, oracle, and protocol exposures.
3. Handle partial exits and failed rebalances without duplicate actions.

Expand where value holds.

Add a second chain only when measured benefits justify transfer costs, delays, and added failure paths.

SEPARATE CHAIN ACCOUNTS

— Asset movement Evidence ---- Authority — Action request

ILLUSTRATIVE SCENARIO · NO LIVE DATA

Transfer confirmation is delayed

See how Falcon handles uncertainty without sending the same allocation twice.

What this stage adds

Add per-chain accounts and an asynchronous transfer workflow. Keep each chain's permission checks local.

What remains open

Second chain, approved transfer route, and measured benefit after transfer costs.

ARCHITECTURE NOTE

State + reconciliation

Committed capital stays in the source account until submission. Track it once through transit and receipt. Reconcile both chains before deployment or retry.

USER OUTCOME

The user can allocate across approved chains while Falcon tracks every amount in transit.

PROOF BEFORE EXPANSION

1. Count in-transit capital once and keep it inside exposure caps.
2. Handle delayed confirmation and reconcile before retrying.
3. Test per-chain permissions and recovery before funded use.

One agent. Broader goals.

Expand cash planning and account coverage. Add securities only through eligible partners with separate controls.

MORE GOALS · DISTINCT ACCOUNTS

— Asset movement Evidence ---- Authority — Action request

ILLUSTRATIVE SCENARIO · NO LIVE DATA

A securities route is unavailable

See how a global product handles a service that a particular user cannot access.

What this stage adds

Add planning across goals and accounts. The first individual user remains the target; team treasury is an optional later product.

What remains open

Broker partner, account permissions, regional access, and demand beyond stablecoin management.

ARCHITECTURE NOTE

Broker account

The broker or its intermediaries hold the securities under the applicable account structure. An interface or wallet connection does not change that custody.

USER OUTCOME

The user hires one agent to coordinate approved financial accounts and explain the whole plan.

PROOF BEFORE EXPANSION

1. Prove permissions and settlement handling for each account.
2. Check customer eligibility for each financial service.
3. Make account custody and pending capital clear to the user.

What exists.

What comes next.

The repository has an advisory engine and a Devnet interface. The proposed MVP connects those parts to a stablecoin mandate.

VERIFIED: 64 web tests passed locally. The offline council demo returned three expected outcomes. These checks do not prove funded operation.

VERIFIED · Source and local checks

Existing foundation

- 01

Market evidence

Provider adapters collect prices and liquidity. An offline fixture exercises healthy, blocked, and missing-data paths.

Evidence
- 02

Council and risk checks

The engine validates a snapshot and returns an advisory verdict. The verdict has no execution authority.

Evidence
- 03

Explanation graph

The current flow builds its graph after the council verdict. That order must change for the proposed decision loop.

Evidence
- 04

Wallet-owned Devnet terminal

Browser code covers quotes, simulation, wallet signatures, and transaction status. The owner signs each transaction.

Evidence

INFERRED · Work required for Stage 01

Proposed first MVP

- 01

An enforceable mandate

Keep spending cash outside delegation. Enforce the investment cap, allowed destinations, and revocation at execution.
- 02

A graph that informs action

Connect new observations to cash needs and risk. Use that context to propose supply, hold, or redeem.
- 03

One verified lending path

Prove USDC supply and redemption on Solana. Confirm that the owner controls receipts and returned funds.
- 04

Observed outcomes

Reconcile balances and costs. Feed results back into the graph. Show failed withdrawals and pending transactions.

The central architecture change

Current code is a starting point. Only a tested supply, hold, and redemption loop can establish the proposed MVP.

See the next hackathon plan →

One treasury demo. One clear deadline.

Recommendation: Crypto World's Fair, Solana track. Demonstrate Stage 01. Keep the wider architecture as the expansion plan.

VERIFIED · Official event and rules, 26 Sep 2026

Colosseum · Crypto World's Fair

12 October 2026

Submission and registration close at **23:59 Pacific**.
Berlin: 13 October, 08:59 CEST.

Already open since 14 September. The Solana ecosystem track awards \$100,000 across ten projects.

Official event ↗

Rules §§5, 6, 14 ↗

VERIFIED · Next scheduled Solana-directory event

Perps and Prediction Markets

2 to 9 October 2026. Exact cutoff time remains unverified.
INFERRED: Plain lending has a weak fit with its perps and prediction scope.

Event ↗ · Start date ↗

VERIFIED · Seeking sponsors

Agentic Payments

No date is listed. Scheduling depends on its funding goal. Watch this theme for agent spending controls.

Official status ↗

Proposed sprint to submission

INFERRED · Planning estimates, not completed work

26 TO 28 SEP

Complete one simulated loop

Set reserve and cap. Feed evidence into the graph. Show a decision and its simulated outcome.

29 SEP TO 3 OCT

Prove the lending path

Test supply, receipt ownership, and redemption in a declared environment. Keep owner signatures until permissions are proven.

4 TO 7 OCT

Show why Falcon stops

Demonstrate stale-data rejection and a blocked cap breach. Test revocation before any delegated execution. Collect user feedback.

8 TO 11 OCT

Package the proof

Record the pitch and demo. Link the repository and test evidence.
Document prior work and demand. Target submission on 11 October.

INFERRED: These dates assume focused work and an available lending test environment. If integration remains simulated, label it clearly. Stage 01 autonomy stays unproven until its controls pass.

VERIFIED · Current Colosseum FAQ

What the submission needs

Repository, a 2 to 3 minute presentation, and a demo of at most 3 minutes. Include team details, demand evidence, and a distribution plan.

Submission FAQ ↗

VERIFIED · Prior-work rule

Disclose what already exists

Earlier code is allowed with disclosure. Judging covers work within the contest window. Use repository history to distinguish work before 14 September from contest work.

Eligibility FAQ ↗

► Least confident decisions

INFERRED demo story: reserve → investment cap → explained decision → lending position → confirmed result. Include one rejected action.

Official sources checked 26 Sep 2026. No registration or submission has been made by this task.

Falcon / Next hackathon

What this pitch rests on.

Current code and proposed change

VERIFIED · Local source read, 26 Sep 2026

`SPEC.md:8` : “The plugin and Rust engine remain read-only.” This records the current engine boundary.

VERIFIED · Local source read, 26 Sep 2026

`engine/src/serve.rs:529` calls `evaluate_council_with_checks`. The later `build_graph` call at line 534 uses the verdict. Inspection proves this order, not live decision quality.

INFERRED · Design proposal

This pitch proposes graph input before each decision, persistent observations, and a separate executor with restricted authority. It does not amend SPEC.md or claim an implemented money manager.

Provider evidence

VERIFIED · Official pages read in this session

Kamino: “The flash borrow and repay must be in the same transaction.” Its supplying page makes withdrawals conditional on available liquidity. [Flash guide](#) · [Supplying](#). Documentation does not prove current reserve settings or our integration.

VERIFIED · Official pages read in this session

Backpack's eligibility page states that Securities is unavailable in the US, UK, UAE, and Japan. It also excludes Backpack EU. [Eligibility](#). This does not establish Falcon's legal classification.

INFERRED · Scope

Swig is a candidate for restricted authority. Its documented roles do not establish a tested Kamino policy. [Permission primitives](#).

Global reach, explicit access

INFERRED · Product proposal

Keep Falcon's positioning global. Enable each financial service only after checking customer eligibility, venue access, and Falcon's service model. Recheck these conditions when the mandate changes.

INFERRED · Release condition

Owner-signed proof transactions come before bounded automation. Customer-funded use requires tested controls and a reviewed launch scope. An audit of a wallet does not prove a new Falcon adapter is correct.

VERIFIED · Documentation boundary

The July 2026 SEC commissioner statement discusses potential securities-law implications of vaults and lending. It is a commissioner statement, not a new rule or a determination about Falcon. [Statement](#).

Least confident decisions

- INFERRED · Integration choice

Swig plus Kamino. Exact instruction limits, receipt ownership, and outstanding exposure enforcement need adversarial integration tests.
- INFERRED · Launch choice

First funded region. US demand is worth testing. Kamino's current US access terms and Falcon's service classification remain unresolved.
- INFERRED · Expansion choice

Value after costs. Several venues and chains may add more cost than benefit. Expand only when measured outcomes justify the added work and risk.
